

# Angle Relationships

A **ray** has a starting point and continues indefinitely in one direction (indicated by one arrowhead).

An **angle** consists of **two rays that start at the same point**, called the **vertex**. Each ray is called a **side** of the angle.

We can denote the angle on the right as angle BAC, or using the symbol “ $\angle$ ” for “angle,” as  $\angle BAC$ .

Note that we list the vertex point in the middle: it is  $\angle B\mathbf{A}C$ , not  $\angle ABC$ . We could also name it  $\angle CAB$ .

In mathematics, we also often denote angles with the beginning letters of the Greek alphabet:  $\alpha$  (alpha),  $\beta$  (beta),  $\gamma$  (gamma), and  $\delta$  (delta). So  $\angle BAC$  can also be called “angle  $\alpha$ .”

Two angles are **adjacent** if they have a **common vertex and share one side**.

In the image on the right,  $\angle \alpha$  and  $\angle \beta$  are adjacent (side-by-side) angles.

1. How many angles do you see in the picture? \_\_\_\_\_

How many degrees do these angles measure?

$\angle ABC =$  \_\_\_\_\_  $^\circ$

$\angle CBD =$  \_\_\_\_\_  $^\circ$

$\angle ABD =$  \_\_\_\_\_  $^\circ$

What is the sum of  $\angle ABC$  and  $\angle CBD$ ? \_\_\_\_\_  $^\circ$

What is the sum of all three angles? \_\_\_\_\_  $^\circ$

2. Measure the angles. Calculate their sum.

$\angle A =$  \_\_\_\_\_  $^\circ$

$\angle B =$  \_\_\_\_\_  $^\circ$

$\angle C =$  \_\_\_\_\_  $^\circ$

$\angle D =$  \_\_\_\_\_  $^\circ$

Sum of the angles = \_\_\_\_\_  $^\circ$

The angles  $\angle\alpha$  and  $\angle\beta$  in this image are adjacent, and they form a straight angle (an angle of 180 degrees). They are called **supplementary angles**.

Two angles are supplementary if their **sum is 180 degrees**:

$$\angle\alpha + \angle\beta = 180^\circ$$

The angles  $\angle\alpha$  and  $\angle\beta$  in this image are adjacent, and they form a right angle. They are called **complementary angles**.

Two angles are complementary if their **sum is 90 degrees**:

$$\angle\alpha + \angle\beta = 90^\circ$$

We can also say, “ $\alpha$  complements  $\beta$ .”

Here’s a mnemonic to help you remember the difference: Supplementary angles form a Straight line, and Complementary angles form a Corner (a right angle).

Supplementary angles don’t have to be adjacent, and neither do complementary angles.

These are still complementary angles, because  $21^\circ + 69^\circ = 90^\circ$ .

These are still supplementary angles, because  $146^\circ + 34^\circ = 180^\circ$ .

3. **a.** Draw a  $38^\circ$  angle. Then draw an adjacent angle that complements it.

**b.** Draw an  $82^\circ$  angle. Then draw an adjacent angle that supplements it.
