

Multiplying in Parts

1. Remember? You can multiply the thousands, hundreds, tens, and ones separately. Then add to get the final answer. This is called multiplying in parts or the partial products algorithm.

<p>a. 4×27</p> <p>$4 \times \underline{20} + 4 \times \underline{7}$</p> <p>_____ + _____</p> <p>= _____</p>	<p>b. 7×83</p> <p>$7 \times \underline{\quad} + 7 \times \underline{\quad}$</p> <p>_____ + _____</p> <p>= _____</p>	<p>c. 8×56</p> <p>_____ \times _____ + _____ \times _____</p> <p>_____ + _____</p> <p>= _____</p>
<p>d. 5×216</p> <p>$5 \times \underline{\quad} + 5 \times \underline{\quad} + 5 \times \underline{\quad}$</p> <p>_____ + _____ + _____</p> <p>= _____</p>	<p>e. $4 \times 3,481$</p> <p>$4 \times \underline{\quad} + 4 \times \underline{\quad} + 4 \times \underline{\quad} + 4 \times \underline{\quad}$</p> <p>_____ + _____ + _____ + _____</p> <p>= _____</p>	

The partial products can also be written under each other, and then added.

$$\begin{array}{r}
 287 \\
 \times 5 \\
 \hline
 35 \\
 400 \\
 + 1000 \\
 \hline
 1435
 \end{array}$$

$5 \times 7 \rightarrow$
 $5 \times 80 \rightarrow$
 $5 \times 200 \rightarrow$

2. Multiply using partial products.

<p>a.</p> $ \begin{array}{r} 492 \\ \times 6 \\ \hline \end{array} $ <p>$6 \times 2 \rightarrow$</p> <p>$6 \times 90 \rightarrow$</p> <p>$6 \times 400 \rightarrow$</p> <p>+</p> <p>_____</p>	<p>b.</p> $ \begin{array}{r} 255 \\ \times 4 \\ \hline \end{array} $ <p>+</p> <p>_____</p>	<p>c.</p> $ \begin{array}{r} 817 \\ \times 7 \\ \hline \end{array} $ <p>+</p> <p>_____</p>
---	---	---

3. Multiply some bigger numbers using partial products.

<p>a.</p> $\begin{array}{r} 2\ 5\ 1\ 0 \\ \times \quad 9 \\ \hline \end{array}$ <p> $9 \times 0 \rightarrow$ $9 \times 10 \rightarrow$ $9 \times 500 \rightarrow$ $9 \times 2,000 \rightarrow$ </p> <p style="text-align: right;">+ _____</p>	<p>b.</p> $\begin{array}{r} 4\ 4\ 7\ 8 \\ \times \quad 5 \\ \hline \end{array}$ <p> $5 \times 8 \rightarrow$ $5 \times 70 \rightarrow$ $5 \times 400 \rightarrow$ $5 \times 4,000 \rightarrow$ </p> <p style="text-align: right;">+ _____</p>	<p>c.</p> $\begin{array}{r} 2\ 6\ 0\ 7\ 2 \\ \times \quad 6 \\ \hline \end{array}$ <p> $6 \times 2 \rightarrow$ $6 \times 70 \rightarrow$ $6 \times 000 \rightarrow$ $6 \times 6000 \rightarrow$ </p> <p style="text-align: right;">+ _____</p>
---	---	---

Remember? The picture on the right illustrates a principle that ties together area, addition, and multiplication.

The total area is $6 \times (7 + 4)$ square units.

The areas of the two parts are 6×7 and 6×4 .

Therefore, $6 \times (7 + 4)$ equals $6 \times 7 + 6 \times 4$.

$$6 \times (7 + 4) = 6 \times 7 + 6 \times 4$$

This principle is called *the distributive property*, because it “distributes” multiplication over addition. In general, we can express it using symbols: $a \times (b + c) = a \times b + a \times c$.

4. Fill in the missing parts, thinking of the area of the whole rectangle, or of the partial rectangles.

<p>a. $6 \times 29 = 6 \times \underline{\quad} + 6 \times \underline{\quad}$</p> <p>$= \underline{\quad} + \underline{\quad} = \underline{\quad}$</p>	
<p>b. $8 \times (10 + 14)$</p> <p>$= 8 \times \underline{\quad} + 8 \times \underline{\quad}$</p> <p>$= \underline{\quad} + \underline{\quad} = \underline{\quad}$</p>	
<p>c. $11 \times (3 + 5 + 6)$</p> <p>$= \underline{\quad} \times \underline{\quad} + \underline{\quad} \times \underline{\quad} + \underline{\quad} \times \underline{\quad}$</p> <p>$= \underline{\quad} + \underline{\quad} + \underline{\quad}$</p> <p>$= \underline{\quad}$</p>
