End-of-Year Test, Grade 7, Answer Key

If you are using this test to evaluate a student's readiness for Algebra 1, I recommend that the student score a minimum of 80% on the first four sections (Integers through Ratios, Proportions, and Percent). The subtotal for those is 120 points. A score of 96 points is 80%.

I also recommend that the teacher or parent review with the student any content areas in which the student may be weak. Students scoring between 70% and 80% in the first four sections may also continue to Algebra 1, depending on the types of errors (careless errors or not remembering something, versus a lack of understanding). Use your judgment.

You can use the last three sections to evaluate the student's mastery of topics in Math Mammoth Grade 7 Curriculum. However, mastery of those sections is not essential for a student's success in an Algebra 1 course.

The two geometry problems marked with an asterisk (*) are beyond the Common Core Standards for 7th grade.

A calculator is *not* allowed for the first three sections of the test: Integers, Rational Numbers, and Algebra. A <u>basic</u> calculator *is* allowed for the last four sections of the test: Ratios, Proportions, and Percent; Geometry, Probability, and Statistics.

My suggestion for points per item is as follows.

Integers

- 1. Answers will vary. Check the student's answer. -15 + 10 = -5. For example: A fish swimming at a depth of 15 ft rose 10 ft, and now it is 5 ft below the surface. Or, Mary owed her mom \$15. She paid back \$10 of her debt, and now she only owes her mom \$5. Or, the temperature was -15° . It rose 10 degrees and now the temperature is -5° .
- 2. Answers will vary. Check the student's answer. $4 \cdot (-2) = -8$. For example: A certain ion has a charge of -2. Four such ions have a charge of -8. Or, four students bought ice cream for \$2 each, but none of them had any money with them. Each of them borrowed \$2 from a teacher. Now, their total debt is \$8. Or, a stick reaches 2 m below the surface of the lake. If we put four such sticks end-to-end, they will reach to the depth of 8 m below the surface.

5. |-5 - (-15)| = |10| = 10

6. The numbers could be: a = 8 and b = -7 or a = 7 and b = -8.

7. a. -1/8 b. -1/4 c. 4 1/5

Rational Numbers

8. a. 1748/10,000 b. -483/100,000 c. 2 43928/1,000,000 9. a. -0.0028 b. 24.93 c. 7.01338 10. a. 0.53846 b. 1.81

11.

a. $1.2 \cdot 25 = 30$

Answers will vary. Check the student's answer. For example: The price of a pair of scissors costing \$25 is increased by 20%. The new price is \$30. Or, a line segment that is 25 cm long is scaled by a scale factor 1.2, and it becomes 30 cm long. Or, the lunch break, which used to be 25 minutes long, is increased by 1/5. Now it is 30 minutes long. b. $(3/5) \div 4 = (3/5) \cdot (1/4) = 3/20$. Answers will vary. Check the student's answer. For example:

There is 3/5 of a large pizza left, and four people share it equally. Each person gets 3/20 of the original pizza. Or, a plot of land that is 3/5 square mile is divided evenly into four parts. Each of the parts is 3/20 square mile = 15/100 sq. mi. = 0.15 sq. mi.

a.
$$-\frac{2}{7} \cdot \left(-3\frac{5}{8}\right) = -\frac{2}{7} \cdot \left(-\frac{29}{8}\right) = \frac{1}{7} \cdot \frac{29}{4} = \frac{29}{28}$$

b. $27.5 \div 0.6$
 $= 275 \div 6$
 $= 45.8\overline{3}$
c. $-0.7 \cdot 1.1 \cdot (-0.001)$
 $= 0.00077$
d. $(-0.12)^2 = 0.0144$
 $= \frac{3}{4} \cdot \frac{12}{5} = \frac{3}{1} \cdot \frac{3}{5} = \frac{9}{5} = 1\frac{4}{5}$
f. $\frac{5\frac{12}{7}}{-\frac{7}{8}}$
 $= \frac{11}{2} \cdot \left(-\frac{8}{7}\right) = \frac{11}{1} \cdot \left(-\frac{4}{7}\right) = -\frac{44}{7} = -6\frac{2}{7}$

13.

a. $-\frac{1}{6} \cdot 1.2$	b. $-\frac{2}{5} \div (-0.1)$
If we use fraction arithmetic, this becomes: = $-\frac{1}{6} \cdot \frac{12}{10} = -\frac{1}{1} \cdot \frac{2}{10} = -\frac{2}{10} = -\frac{1}{5}$	If we use decimal arithmetic, this becomes $-0.4 \div 0.1 = 4$ (because $4 \cdot 0.1 = 0.4$). With fraction arithmetic, we get
If we use decimal arithmetic, we get $-\frac{1}{6} \cdot 1.2 = 1.2 \cdot \left(-\frac{1}{6}\right) = 1.2 \div (-6) = -0.2$	$-\frac{2}{5} \div \left(-\frac{1}{10}\right) = \frac{2}{5} \cdot \frac{10}{1} = 4$

14.

a.
$$-\frac{1}{2} + \frac{5}{2} \cdot (-0.8) = -0.5 + 2.5 \cdot (-0.8)$$

 $= -0.5 + (-2) = -2.5$
Or, with fractions: $-\frac{1}{2} + \frac{5}{2} \cdot (-0.8)$
 $= -\frac{1}{2} + \frac{5}{2} \cdot \left(-\frac{8}{10}\right) = -\frac{1}{2} + \frac{1}{1} \cdot \left(-\frac{4}{2}\right)$
 $= -\frac{1}{2} + (-2) = -2\frac{1}{2}$
b. $\frac{5}{8} \cdot 0.4 \cdot \left(-\frac{2}{3}\right) - 1.25$
 $= \frac{5}{8} \cdot \frac{2}{5} \cdot \left(-\frac{2}{3}\right) - 1.25 = -\frac{2}{12} - \frac{5}{4}$
 $= -\frac{2}{12} - \frac{15}{12} = -\frac{17}{12} = -1\frac{5}{12}$

Algebra

15.

a. 15 <i>s</i> – 10	b. $5x^4$	c. $3a + 3b - 6$
d. 1.02 <i>x</i>	e. $2w - 4$	f. $-3.9a + 0.5$

16.

a. $7x + 14$	b. 15 – 5y	c. $21a + 24b - 9$
=7(x+2)	= 5(3-y)	=3(7a+8b-3)

17.

a. $2x-7 = -6 + 7$ 2x = 1 - 2 x = 1/2	b. $2-9 = -z+4$ -7 = -z+4 -4 $-11 = -z$ \div (-1) z = 11
c. $120 = \frac{c}{-10}$ · (-10) -1200 = c c = -1200	d. $2(x + \frac{1}{2}) = -15$ 2x + 1 = -15 - 1 $2x = -16$ $\div 2$ x = -8

18.

a. $\frac{2}{3}x = 266$ • 3	b. $x + 1\frac{1}{2} = \frac{3}{8}$ -11/2
$2x = 798 \div 2$ $x = 399$	$x = \frac{3}{8} - 1\frac{1}{2}$ $x = \frac{3}{8} - \frac{12}{8} = -\frac{9}{8} = -1\frac{1}{8}$
c. $-5y + 9y - 2 + y = 10$ 5y - 2 = 10 + 2 5y = 12 ÷ 5 y = 12/5	d. $2(x+7) - 3x = -36$ 2x + 14 - 3x = -36 14 - x = -36 -14 -x = -50 x = 50
e. $\frac{y+6}{-2} = -10$ · (-2) y+6 = 20 -6 y = 14	f. $\frac{w}{2} - 3 = 0.8$ w - 6 = 1.6 w = 7.6 $\cdot 2$ + 6

19. From the formula d = vt we can find that t = d/v. In this case, t = 0.8 km/(12 km/h) = 0.8/12 hr = 8/120 hr = 1/15 hr= 1/15 hr \cdot (60 min/hr) = <u>4 minutes</u>. This is reasonable because the distance he ran is fairly short.

20. Let *x* be the side of the regular hexagon. It is also the shorter side of the rectangle. Then, the perimeter is 6x + 30. The equation is 6x + 30 = 72, from which 6x = 42 and x = 7. The side of the hexagon measures <u>7 units</u>.

a.

$$3x - 7 < 83$$
 $+7$
 b.
 $-2x - 16.3 > 10.5$
 $+16.3$
 $3x < 90$
 $\div 3$
 $-2x > 26.8$
 $\div (-2)$
 $x < 30$
 $x < -13.4$

22. a. Let *n* be the number of boxes. The cost of the boxes with the discount is 19n - 25. The inequality is $19n - 25 \le 170$. Solution:

b. The solution means that you can buy 10 boxes at most.

Ratios, Proportions, and Percent

23.

21.

a. Lily paid \$6 for 3/8 lb of nuts.
$\frac{\$6}{\frac{3}{8}}$ lb = $\$6 \cdot \frac{8}{3}$ per lb = $\$16$ per lb
b. Ryan walked 2 ¹ / ₂ miles in 3/4 of an hour.
$\frac{2\frac{1}{2} \text{ mi}}{\frac{3}{4} \text{ h}} = \frac{5}{2} \cdot \frac{4}{3} \text{ mi/h} = \frac{20}{6} \text{ mi/h} = 3\frac{1}{3} \text{ mi/h}$

24. a. The speed of the moped is 30 km/h.

- b. See the image on the right. The point is (4, 120), and it signifies that after driving 4 hours, the moped has covered 120 km.
- c. d = 30t
- d. See the image. It is the point (1, 30).
- 25. a. The <u>Toyota</u> Prius gets better gas mileage, because it gets 565 mi/11.9 gal \approx 47.48 mi/gal whereas the Honda Accord gets 619 mi/17.2 gal \approx 35.99 mi/gal.
 - b. The cost of driving 300 miles with a Toyota Prius is 300 mi \cdot (11.9 gal/565 mi) \cdot \$3.19/gal \approx \$20.16. The cost of driving 300 miles with a Honda Accord is 300 mi \cdot (17.2 gal/619 mi) \cdot \$3.19/gal \approx \$26.59. The difference is \$26.59 - \$20.16 = <u>\$6.43</u>.

26. Proportions vary as there are several different ways to write the proportion correctly. Here are four of the correct ways. Besides these four, you will get four more by switching the right and left sides of these four equations.

600 ml	5000 ml	554 g	x	5000 ml	x	600 ml	_ 554 g
554 g –	x	600 ml	5000 ml	600 ml	554 g	5000 ml	x

The key point is that in each of the correct ways, x ends up being multiplied by 600 ml in the cross-multiplication. If x ends up being multiplied by 554 g or 5,000 ml in the cross-multiplication, the proportion is set up incorrectly.

Here is the solution process for one of the proportions above. Each of the others has the same final solution, x = 4.617 g.

600 ml	_	5000 ml
554 g	_	x
$600 \text{ ml} \cdot x =$	=	554 g \cdot 5000 ml
<i>x</i> =	=	$\frac{554 \text{ g} \cdot 5000 \text{ ml}}{600 \text{ ml}}$
<i>x</i> =	=	4,617 g

27. a. These two quantities are *not* in proportion. For example, looking at the cost of potatoes for 5 lb and for 20 lb, the weight increases four-fold, but the cost increases about 3.5 times (from \$4.50 to \$16). Or, when the weight increases three-fold from 5 lb to 15 lb, the price does not increase three-fold, but from \$4.50 to \$13.

Another way to see that is in the beginning of the chart, the weights increase by 5 lb up to 20 lb, but the cost does not increase by the same amount. Instead, the cost increases first by \$4.50, then by \$4, then by \$3.

- b. There is no need to answer this, since the quantities are not in proportion.
- 28. She can withdraw $2,500 \cdot 0.08 \cdot 3 + 2,500 = 600 + 2,500 = 3,100$.
- 29. Let *p* be the price of the gadget before the discount and the sales tax. Then, the price after the discount is 0.82p and the price after the sales tax is $1.055 \cdot 0.82p$. We get the equation

$$1.055 \cdot 0.82p = 51.82$$

$$0.8651p = 51.82 \qquad \div 0.8651$$

$$p = 59.90$$

The gadget cost \$59.90 before the discount and the sales tax.

- 30. After the 15% price increase, the ticket costs $1.15 \cdot \$20 = \23 . Then, the price decreased by 25% is $0.75 \cdot \$23 = \17.25 .
- 31. Let p be the price of the mattress originally. Then, Margaret paid 0.8p 30. We get the equation:

The mattress cost \$217.50 originally,

- 32. Let *r* be the amount of rainfall in the previous month. Then, 1.35r = 10.5 cm, from which r = 10.5 cm/ $1.35 \approx 7.8$ cm.
- 33. a. The percentage of increase was $(72,000 51,500)/51,500 \approx 39.8\%$.

b. She will have $1.398 \cdot 72,000 = 100,656$ visitors $\approx 101,000$ visitors.

Geometry

- 34. a. The given rectangle measures 7 cm by 10 cm. We multiply those by 45 to get the true dimensions: 7 cm \cdot 45 = 315 cm = 3.15 m and 10 cm \cdot 45 = 450 cm = 4.5 m. The area is A = 3.15 m \cdot 4.5 m = 14.175 m².
 - b. The dimensions of the room at a scale 1:60 will be 45/60 = 3/4 of the dimensions of the room drawn at a scale of 1:45 so the scale drawing will be smaller than the drawing given in the problem. The width is $(3/4) \cdot 7$ cm = 5.25 cm and the height is $(3/4) \cdot 10$ cm = 7.5 cm.

Or, you can divide the actual dimensions by 60 to get 315 cm \div 60 = 5.25 cm and 450 cm \div 60 = 7.5 cm.

Scale 1:45

- 35. We simply multiply the given dimensions (which are in inches) by the ratio 3 ft/1 in, essentially multiplying them by 3:
 - $4 \frac{1}{4}$ in \cdot (3 ft/1 in) = 12 3/4 ft or 12 ft 9 in and

 $3 \frac{1}{2}$ in \cdot (3 ft/1 in) = 10 $\frac{1}{2}$ ft or 10 ft 6 in.

36. The side of the enlarged square is $(4/3) \cdot 15 \text{ cm} = 20 \text{ cm}$. Its area is $20 \text{ cm} \cdot 20 \text{ cm} = \frac{400 \text{ cm}^2}{2}$.

37. a. Area = $\pi \cdot (8 \text{ cm})^2 \approx 201 \text{ cm}^2$. Circumference = $\pi \cdot 16 \text{ cm} \approx 50.3 \text{ cm}$.

b. The radius of this smaller circle is $0.8 \cdot 8 \text{ cm} = 6.4 \text{ cm}$. Its area = $\pi \cdot (6.4 \text{ cm})^2 \approx 129 \text{ cm}^2$. Circumference = $\pi \cdot 12.8 \text{ cm} \approx 40.2 \text{ cm}$.

c.
$$\frac{\pi \cdot (6.4 \text{ cm})^2}{\pi \cdot (8 \text{ cm})^2} = \frac{(6.4 \text{ cm})^2}{(8 \text{ cm})^2} = \frac{40.96 \text{ cm}^2}{64 \text{ cm}^2} = 0.64 = 64\%$$

38. Check the student's drawing. The image below is not to true scale, but the student's drawing of a triangle should have the same shape as the triangle below. It will just be larger.

39. a. No, it doesn't.

b. The three given angles determine the shape of the triangle. The 8-cm side can be opposite of any of the given angles, so we get three triangles of different sizes. The images below are not to true scale but are smaller than in reality. They give you an idea of what the three different triangles look like. Check the student's drawings.

40.
$$5x + 2x + 8x = 360$$

 $15x = 360$ \div 15
 $x = 24$

The angles measure $5 \cdot 24^{\circ} = \underline{120^{\circ}}, 2 \cdot 24^{\circ} = \underline{48^{\circ}}, \text{ and } 8 \cdot 24^{\circ} = \underline{192^{\circ}}.$

41. a. There are several ways to write an equation for *x*.

(1) Since angle x and the 53° angle are supplementary, $x + 53^\circ = 180^\circ$, from which $x = 180^\circ - 53^\circ = 127^\circ$.

(2) Angle *y* and the 53° angle are vertical angles, so $y = 53^{\circ}$. Then, angle *x* and angle *y* are supplementary, so we can write the equation $x + 53^{\circ} = 180^{\circ}$, and once again $x = 180^{\circ} - 53^{\circ} = 127^{\circ}$.

b. There are several ways to write an equation for *z*.

(1) Since angles y, z, and the 18° angle make a straight angle, their measures sum up to 180° , and we can write $y + z + 18^{\circ} = 180^{\circ}$. Since y and the 53° angle are vertical angles, $y = 53^{\circ}$ and we can substitute that for y in the equation to get:

 $53^{\circ} + z + 18^{\circ} = 180^{\circ}$ $z = 180^{\circ} - 53^{\circ} - 18^{\circ}$ $z = 109^{\circ}$

(2) Or, since the combination angle $z + 18^{\circ}$ and x are vertical angles, $z + 18^{\circ} = x$. From part (a) we know that $x = 127^{\circ}$ so the equation becomes:

$$z + 18^{\circ} = 127^{\circ}$$
$$z = 127^{\circ} - 18^{\circ}$$
$$z = 109^{\circ}$$

42. a. The cross section is a <u>rectangle</u>. b. The cross section is a <u>triangle</u>. c. The cross section is a <u>trapezoid</u>.

43. a. The roof or top part of the entire canopy is a triangular prism. The base of the prism is a triangle with a base side of 10 ft and a height of 4 ft, so its area is 10 ft \cdot 4 ft / 2 = 20 ft².

The volume is $V = A_b \cdot h = 20 \text{ ft}^2 \cdot 14 \text{ ft} = 280 \text{ ft}^3$.

b. The bottom part is a rectangular prism, and its volume is $10 \text{ ft} \cdot 14 \text{ ft} \cdot 8 \text{ ft} = 1,120 \text{ ft}^3$.

The total volume is $280 \text{ ft}^3 + 1,120 \text{ ft}^3 = 1,400 \text{ ft}^3$.

44. From the cube, we need to add the areas of the five square faces, plus half of the area of the top face: $A_{cube} = 5 \cdot 2 \cdot 2 + 2 \cdot 2 / 2 = 20 + 2 = 22$ square units

From the triangular prism, we will get the top face and three lateral faces. The top face is a right triangle with 2-unit sides, so its area is $2 \cdot 2/2 = 2$ square units. The three lateral faces have a total area of $2.8 \cdot 2 + 2 \cdot 2 + 2 \cdot 2 = 5.6 + 4 + 4 = 13.6$ square units.

In total, the surface area of the shape is 22 + 2 + 13.6 = 37.6 square units.

45. a. One way is to use the formula for the area of a trapezoid. See the image on the right. The area of one trapezoid is A = $(10 \text{ cm} + 15 \text{ cm})/2 \cdot 7.5 \text{ cm} = 93.75 \text{ cm}^2$. Then, the area of the two trapezoids is $2 \cdot 93.75 \text{ cm}^2 = \underline{187.5 \text{ cm}^2}$.

Another way is to subtract the area of the two white triangles from the area of the entire 15 cm by 15 cm square.

The area of one triangle is $15 \text{ cm} \cdot 2.5 \text{ cm}/2 = 18.75 \text{ cm}^2$. The area of the two trapezoids is then $15 \text{ cm} \cdot 15 \text{ cm} - 2 \cdot 18.75 \text{ cm}^2 = 187.5 \text{ cm}^2$.

b. The trapezoids cover $187.5/(15 \cdot 15) \approx 83.3\%$ of the entire square.

46. a. $V = A_b \cdot h = \pi \cdot (6 \text{ cm})^2 \cdot 4.5 \text{ cm} = 508.938 \text{ cm}^3 \approx 509 \text{ cm}^3$.

b. The volume is 509 ml = 0.509 L.

4 ft 4 ft 10 ft 14 ft 8 ft

47. a. Since 1 ft = 12 in, 1 cubic foot has 12 in \cdot 12 in \cdot 12 in $= 1,728 \text{ in}^3$.

Probability

48. a. P(not red) = 8/10 = 4/5

- b. P(blue or red) = 5/10 = 1/2
- c. P(green) = 0

- b. P(beef, rice, coleslaw) = 1/24
- c. P(no coleslaw nor steamed cabbage) = 12/24 = 1/2
- d. P(chicken, green salad) = 3/24 = 1/8
- 50. None of the conclusions (a), (b), or (c) are valid.
 - (a) This die is unfair.

Not valid. In a repeated random experiment, the frequencies for the various outcomes do vary, and the variability seen in the chart is definitely within normal variation. In fact, the data comes from running a computer simulation that uses random numbers, and the simulation was run 1,000 times.

(b) On this die, you will always get more 1s than 6s.

Not valid. The die is not necessarily unfair. A normal die could produce the frequencies seen in the chart.

(c) Next time you roll, you will not get a 4.

Not valid. Rolling a die is a random experiment and you might get 4 the next time you roll.

51. Answers will vary; check the student's answer. We can toss 10 coins (or a single coin 10 times) to simulate 10 children being born. Let heads = girl, and tails = boy (or vice versa).

Then, repeat that experiment (tossing 10 coins) hundreds of times. Observe how many of those repetitions include 9 heads and one tail, which means getting 9 girls and one boy. The relative frequency is the number of times you got 9 heads and one tail divided by the number of repetitions, and gives you an approximate value for the probability of 9 girls and 1 boy in 10 births.

Statistics

- 52. Cindy's sampling method is <u>biased</u>. She chose students from her class, which means that all the other students in the college didn't have a chance to be selected in her sample. For a sampling method to be unbiased, every member of the population has to have an equal chance of being selected in the sample. (Her method would work if she was only studying the students in her class.)
- 53. Four people are running for mayor in a town of about 20,000 people. Three polls were conducted, each time asking 150 people who they would vote for. The table shows the results.

	Clark	Taylor	Thomas	Wright	Totals
Poll 1	58	19	61	12	150
Poll 2	68	17	56	9	150
Poll 3	65	22	53	10	150

- a. Based on the polls, we can predict <u>Clark</u> to be the winner of the election. He is leading in two of the three polls.
- b. To estimate how many votes Thomas will get, use the average percentage of votes he got in the three polls. You can calculate that as $((61 + 56 + 53) \div 3)/150$ or as $(61/150 + 56/150 + 53/150) \div 3$. Either way, you will get 37.78%. This gives us the estimate that he would get $0.3778 \cdot 8,500 \approx 3,200$ votes in the actual election.
- c. We will gauge how much off the estimate of 3,200 votes is by using the individual poll results. Based on poll 1, we would estimate Thomas to get $(61/150) \cdot 8,500 \approx 3,460$ votes. Based on poll 2, we would estimate Thomas to get $(56/150) \cdot 8,500 \approx 3,170$ votes. Based on poll 3, we would estimate Thomas to get $(53/150) \cdot 8,500 \approx 3,000$ votes.

Looking at the highest and lowest numbers (3,000 and 3,460), we can gauge that our estimate of 3,200 votes might be <u>off by a few hundred votes</u>.

54. The total number of people Gabriel surveyed is $45 + 57 + 18 = 120$. Of those, $45/120 = 37.5\%$ support building the highway.	Opinion	Numl
This gives us the estimate that $0.375 \cdot 2,120 = 795 \approx 800$ households	Support the highway	45
in the community would support building the highway.	Do not support it	57
	No opinion	18

- 55. a. Chickens in Pasture 1 appear to weight more. The median for this flock is 2.1 kg versus the median of about 1.96 kg for the chickens in Pasture 2.
 - b. The interquartile ranges for both groups are similar. Also, the ranges are similar. So, the weights of chickens seem to vary about the same amount in either flock.
 - c. Yes, chickens on Pasture 1 are significantly heavier than the chickens on Pasture 2.

The median for Pasture 1 is 2.1 kg and for Pasture 2, about 1.96 kg — a difference of about 0.14 kg. The interquartile ranges are about 0.13 kg for both Groups. The difference in the medians (about 0.14 kg) is more than one time the interquartile range (about 0.13). You can also see that visually. These are the entire populations (not samples), therefore the difference is significant.
