Introduction

*Math Mammoth Grade 4 Review Workbook* is intended to give students a thorough review of fourth grade math. The book has both topical as well as mixed (spiral) review worksheets, and includes both topical tests and a comprehensive end-of-year test. The tests can also be used as review worksheets, instead of tests.

You can use this workbook for various purposes: for summer math practice, to keep the child from forgetting math skills during other break times, to prepare students who are going into fifth grade, or to give fourth grade students extra practice during the school year.

The topics reviewed in this workbook are:

- addition, subtraction, graphs, and algebraic thinking
- large numbers and place value
- multi-digit multiplication
- time and measuring
- division
- geometry
- fractions and decimals

In addition to the topical reviews and tests, the workbook also contains many cumulative (spiral) review pages.

The content for these is taken from *Math Mammoth Grade 4 Complete Curriculum*, so naturally this workbook works especially well to prepare students for grade 5 in Math Mammoth. However, the content follows a typical study for grade 4, so this workbook can be used no matter which math curriculum you follow.

Please note this book does not contain lessons or instruction for the topics. It is not intended for initial teaching. It also will not work if the student needs to completely re-study these topics (the student has not learned the topics at all). For that purpose, please consider the *Math Mammoth Grade 4 Complete Curriculum*, which has all the necessary instruction and lessons.

*I wish you success with teaching math!*

**Addition, Subtraction, and Algebraic Thinking Test**

1. Solve: \(2,392 + x = 5,003\).

2. Calculate in the right order.

   a. \((40 + 90) \times 2\)
   
   b. \((50 – 10) ÷ (5 – 3)\)
   
   c. \(50 + 10 \times 4 – 20\)

3. Find the expression that matches the problem below.

   What is the change you get if you buy seven light bulbs for $2 each, and you pay with $20?

   Lastly, solve the problem.

   \(7 \times $2 – $20\)  
   \($20 – $2) \times 7\)  
   \($20 – 7 \times $2\)  
   \(7 \times $20 – $2\)

4. Estimate the total cost using rounded numbers.

   Do **not** find the exact cost.

   A bicycle helmet, $28.95 and TWO flashlights, $14.25 each.

5. Edward had three rolls of plastic. The first one was 10 meters long, the second was 2 m shorter, and the third was 5 m longer than the first one. What is the total length of the three rolls of plastic?

6. Mark the numbers and the unknown (\(x\) or ?) in the bar model. Write an addition or a subtraction with an unknown. Solve it.

   A computer program has been discounted by $48, and now it costs $67. What was the original price?

   \[\text{original price} \quad \begin{array}{c} \text{discounted price} \end{array}\]
